New Page Addition

The Cart page is **new** but appears as a module that slides in from the right. Although I did not make a new HTML document for the cart, I added in the new functionality to all the pages. In addition to the cart page, I created a new page for the wishlist.

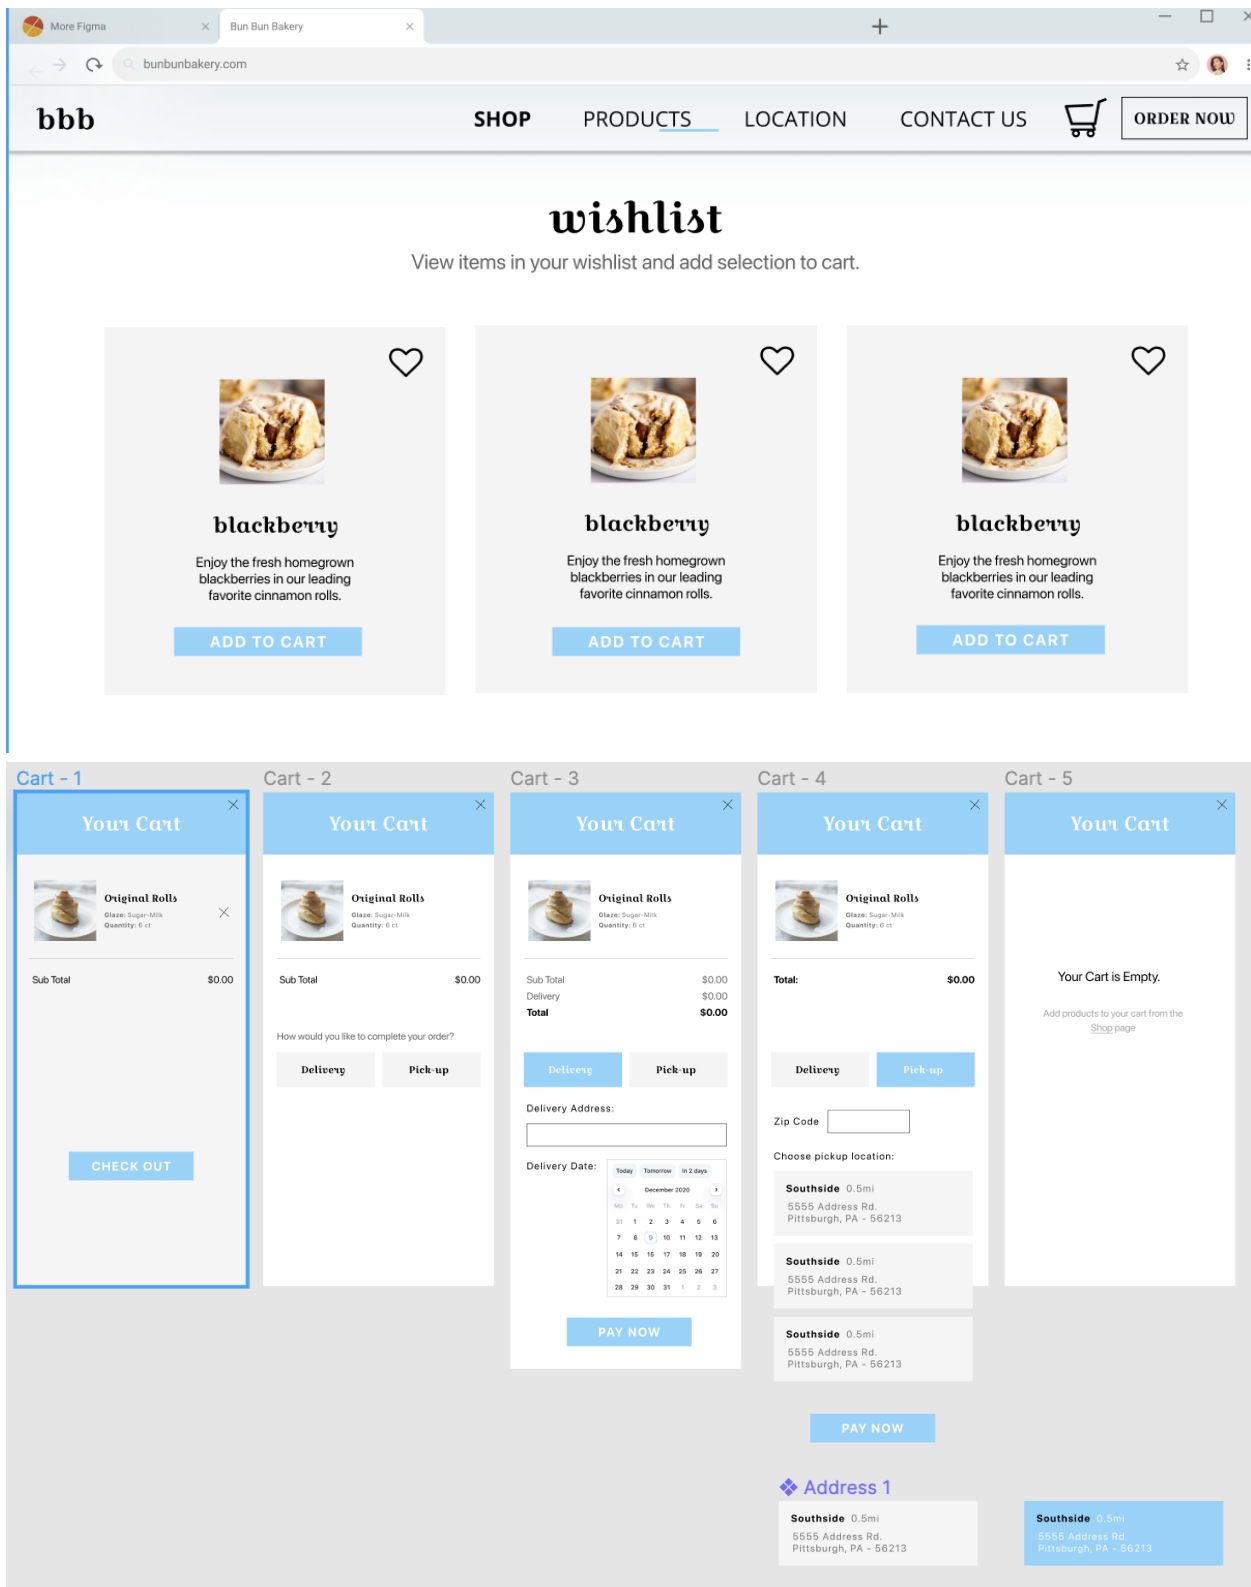

Low Fidelity Prototype

I opted in for a module that opens to the right for the cart design so that it was always accessible and would provide consistent feedback to the user every time something is added to the cart. This design also helps indicate to users immediately that there is a cart available to be viewed. This cart design is not as heavy as other cart designs.

The wishlist design is meant to look different from the shop page and the cart. You can only add flavors to your wishlist and when you decide to move something to the cart, you are prompted to make a selection as to what glaze and quantity you would like.

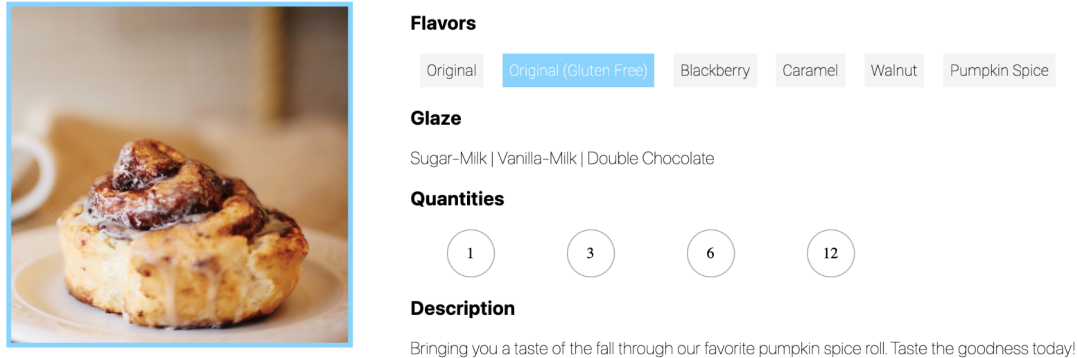

High Fidelity Prototype - [Figma](#), [Walkthrough](#)

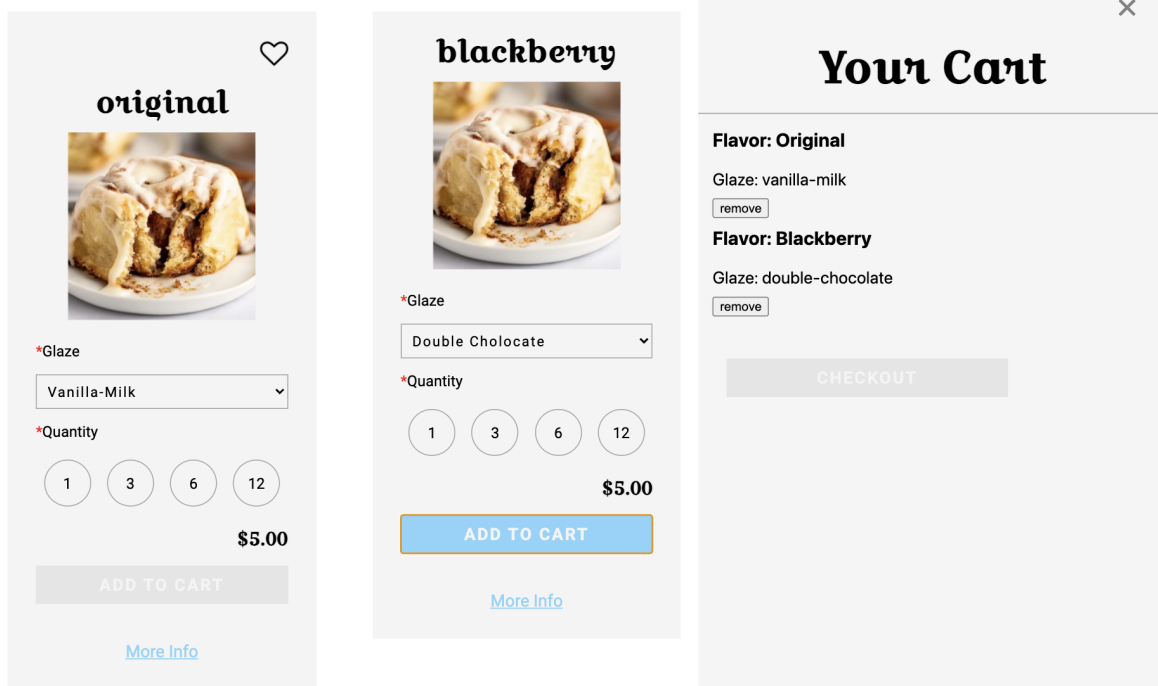

New Feature

On the product detail page, users have the option to click on different flavors and the description of the product will change accordingly.

Within the cart module, users can select the flavor and glaze that they like and the cart will reflect the chosen selections.

Extra Credit

- Began adding wishlist functionality
- Changed the original ordering cards to now include a wishlist indicator, the heart
- Edited navigation bar to include a wishlist page
- Linked the wishlist page to all the other pages
